R Markdown

This is an R Markdown document. It's great for writing a report along with your code so that everything is in one place. When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks (Foa and Mounk 2017) within the document. You can embed an R code chunk like this:

```
library(tidyverse)
```

Importing Data

R Markdown always looks for files relative to the folder where it is saved. This can sometimes be a pain. For example, this .Rmd file is in the `R/week-06/` folder, but I want to load a data file in the `data/` folder. The `here()` function is useful, because it tells R to look for things relative to your `.Rproj` file instead (you'll need to install the `here` package if you don't have it).

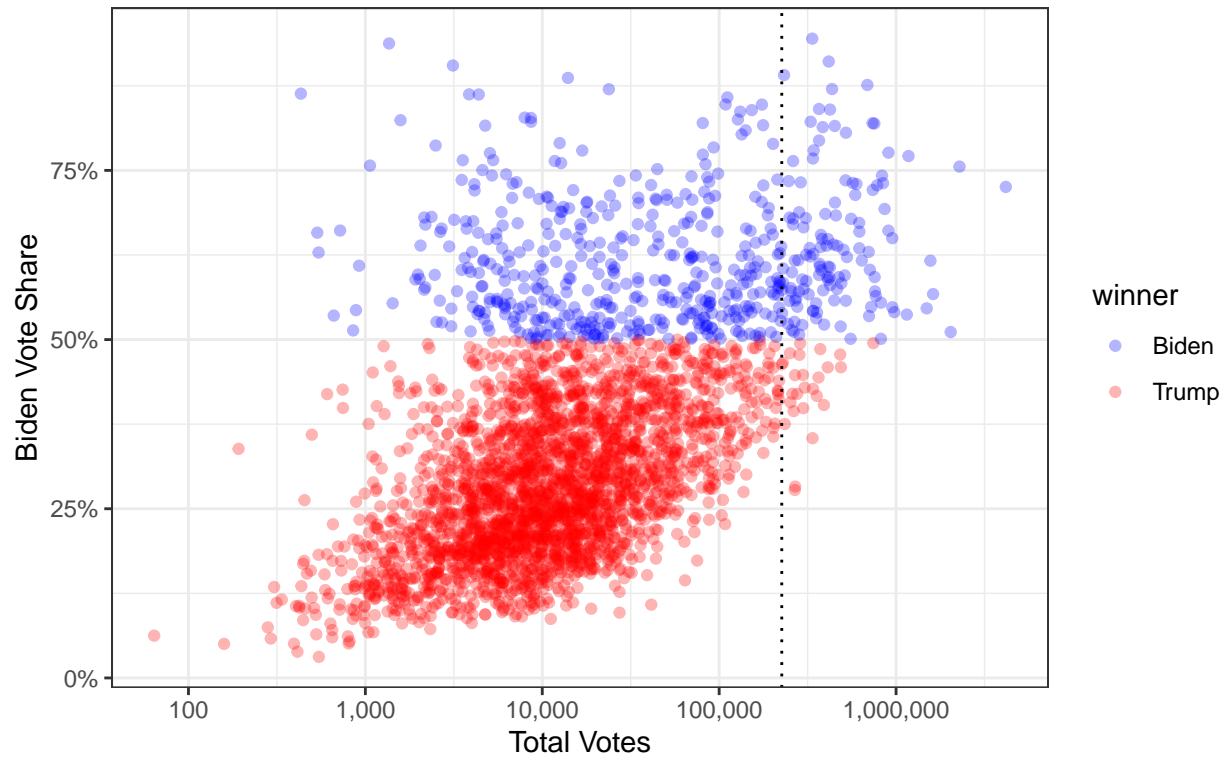

```
library(here)
```

```
load( here( 'data/county-results-2020.RData' ) )
```

Including Plots

You can also embed plots, for example:

County-Level Election Results (2020)

Fun fact: half of the people who voted in 2020 live in the 152 counties to the right of the dotted line

Note that the `echo = FALSE` parameter was added to the code chunk to prevent printing of the R code that generated the plot.
